

24 Hour Digital Clock

EE24BTECH11053 - S A Aravind Eswar

1 INTRODUCTION

I have built a 24 hour clock, with 2 modes, running with help of incremental logic.

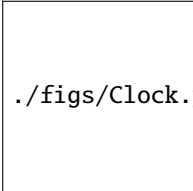

2 WORKING

The first mode is normal function mode, where it displays currently set time(normal mode). In mode two, we can set time being displayed(set mode).To switch between the modes, we press button 1.

Once you enter the set mode, the seconds segment will start blinking. This indicates currently seconds is selected to change. To circulate between seconds, minutes and hours segments, press button 2. The currently selected segment will blink. To change the time displayed the current segment, press button 3. For hours and minutes, the time increments, meanwhile for seconds, it resets back to 00. The clock doesn't stop ticking in this mode.

In normal mode, the clock runs normally and buttons button 2 and button 3 are disabled.
